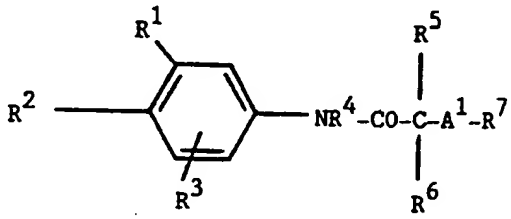
Description

This invention relates to new amide derivatives and more particularly it relates to novel acylanilides which possess antiandrogenic properties.

It is known from European Patent Applications Nos. 0040932 and 0100172 that certain acylanilide derivatives possess antiandrogenic properties.

It is also known from European Patent Application No. 0184822 that certain acylanilide derivatives possess activity as cerebral metabolism stimulants or nootropic agents.

According to the invention there is provided an acylanilide of the formula:



wherein R^1 is cyano, carbamoyl, nitro, fluoro, chloro, bromo, iodo or hydrogen, or alkyl, alkoxy, alkanoyl, alkylthio, alkylsulphinyl, alkylsulphonyl, perfluoroalkyl, perfluoroalkylthio, perfluoroalkylsulphinyl or perfluoroalkylsulphonyl each of up to 4 carbon atoms, or phenylthio, phenylsulphinyl or phenylsulphonyl;

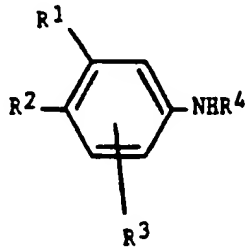
The acylanilides of the invention may be manufactured by any chemical process known to be suitable for the manufacture of chemically-analogous compounds.

A preferred process for the manufacture of an acylanilide of the invention comprises the reaction of an amine of the formula:-



wherein R^1, R^2, R^3 and R^4 have th meanings stated above, with an acid of the formula:-

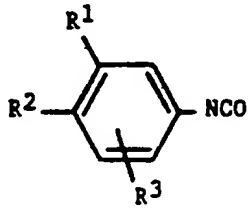
$HO_2C\text{-}CR^5R^6\text{-}A^1\text{-}R^7$

wherein R^5, R^6, R^7 and A^1 have the meanings stated above, or with a reactive derivative of said acid.

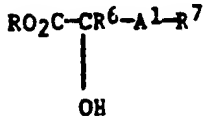
A suitable reactive derivative of an acid is, for example, an acid anhydride, or an acyl halide, for example an acyl chloride, or a lower alkyl ester of said acid, for example the methyl or ethyl ester.

Preferably the reaction is carried out in N,N-dimethylacetamide solution using an acyl chloride (prepared from the acid and thionyl chloride) as reactant.

An acylanilide of the invention wherein R^4 and R^5 are joined together to form a carbonyl-oxy group, that is, an oxazolidinedione, may be prepared by the reaction of an isocyanate of the formula:-

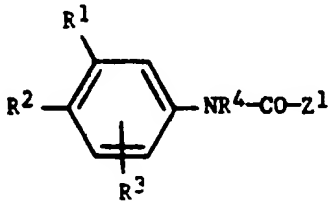


wherein R^1, R^2 and R^3 have the meanings stated above, with an ester of the formula:-

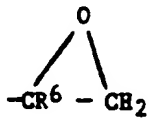


wherein R^6, R^7 and A^1 have the meanings stated above, and wherein R is alkyl of up to 6 carbon atoms, for example methyl or ethyl. This reaction is preferably carried out in an organic solvent, for example diethyl ether, at laboratory temperature.

An acylanilide of the invention wherein R^7 is heterocyclic and A^1 is methylene may be prepared by the reaction of an epoxide of the formula:-



wherein R^1, R^2, R^3 and R^4 have the meanings stated above and wherein Z^1 has the formula:-



wherein R^6 has the meaning stated above, with a heterocycle or a reactive derivative thereof of the formula R^7-M wherein R^7 has the meaning stated immediately above and M is a metal radical. The reaction is preferably carried out in an inert diluent or solvent, for example diethyl ether or tetrahydrofuran at or near laboratory temperature, for example at between 0 °C and 50 °C.

The epoxide used as starting material may be obtained by the epoxidation, for example with a peracid,

of the corresponding unsaturated acylanilide.

A suitable reactive derivative of a heterocycle of the formula R^7-M is, for exampl , an alkali metal salt of the heterocycle, for xample the lithium or sodium salt, which may be prepared by the reaction of the heterocycle with, for example, an alkali metal alkyl, for example butyllithium.

The last-mentioned reaction is preferably carried out in an inert solvent, for example diethyl ether or tetrahydrofuran, at a low temperature, for example at between -30° and -80° C.

An acylanilide of the invention wherein R^5 is hydroxy may be prepared by the hydrolysis of the corresponding acylanilide wherein R^5 is acyloxy, and an acylanilide of the invention wherein R^5 is hydroxy and R^4 is hydrogen may be prepared by the hydrolysis of the corresponding oxazolidinedione, which may be prepared as described above.

An acylanilide of the invention wherein R^4 is alkyl may be prepared by the alkylation of the corresponding acylanilide wherein R^4 is hydrogen.

An acylanilide of the invention wherein R^5 is acyloxy may be prepared by the acylation of the corresponding acylanilide wherein R^5 is hydroxy.

An oxazolidinedione of the invention, wherein R^4 and R^5 are joined together to form a carbonyl-oxy group, may be prepared by the reaction of the corresponding acylanilide wherein R^4 is hydrogen and R^5 is hydroxy with phosgene ($COCl_2$).

An acylanilide of the invention wherein one or more of R^1, R^2 and a substituent in the phenyl or heterocyclic group R^7 is alkylsulphinyl, perfluoroalkylsulphinyl or phenylsulphinyl, or is alkylsulphonyl, perfluoroalkylsulphonyl or phenylsulphonyl, may be prepared by the oxidation of the corresponding acylanilide wherein one or more of R^1, R^2 and a substituent in the phenyl or heterocyclic group R^7 is alkylthio, perfluoroalkylthio or phenylthio, respectively. The oxidising agent and conditions used will determine whether a sulphinyl or sulphonyl compound is obtained. Thus oxidation with sodium metaperiodate in methanol solution at or below laboratory temperature will generally convert a thio compound into the corresponding sulphinyl compound; and oxidation with a peracid, for example m-chloroperbenzoic acid in methylene chloride solution at or above laboratory temperature will generally convert a thio compound into the corresponding sulphonyl compound.

A racemic acylanilide of the invention wherein R^5 is hydroxy may be separated into its optical isomers by forming an ester of the hydroxy group R^5 with an optically-active acid, for example (-)-camphanic acid, separating the diastereoisomeric esters thus obtained, by fractional crystallisation or, preferably, by flash-chromatography, and then hydrolysis of each separate ester to the alcohol.

As stated above, an acylanilide of the invention possesses antiandrogenic properties as demonstrated by its ability to decrease the weight of the seminal vesicles of a mature male rat when administered orally for 4 successive days. An acylanilide of the invention may be used in the treatment of, for example, malignant or benign prostatic disease or of androgen dependent disease conditions, such as acne, hirsutism or seborrhoea, in warm-blooded vertebrates including man. It may also be used to improve ovulation in a domestic animal.

A preferred acylanilide of the invention is up to 10 times more active as an antiandrogen than the known, chemically-related antiandrogens flutamide and hydroxyflutamide. At a dose of an acylanilide of the invention which produces antiandrogenic activity in rats no symptoms of toxicity are apparent.

Some of the acylanilides of the invention also possess other hormonal or antihormonal activity, for example progestational or antiprogestational activity, or both such activities.

Any progestational activity possessed by an acylanilide of the invention can be demonstrated by its ability to promote glandular development in the endometrium of an oestrogen-primed immature rabbit, the standard Clauberg assay procedure. An acylanilide of the invention which possesses progestational activity may be used as a contraceptive, and in the treatment of menstrual disorders, such as dysmemorrhea, dysfunctional bleeding and premenstrual tension, and in the treatment of hormone dependent tumours, especially those of the breast or endometrium. It may also be used for the synchronisation of oestrus and for the maintenance of early pregnancy in domestic animals such as cattle. At a dose of an acylanilide of the invention which produces progestational activity in rabbits no symptoms of toxicity are apparent.

Any antiprogestational activity possessed by an acylanilide of the invention can be demonstrated by its ability to terminate by day 16 the pregnancy of a mature female rat when administered subcutaneously twice on day 9 and once on day 10 of the pregnancy. An acylanilide of the invention which possesses antiprogestational activity may be used as a contraceptive, and in the treatment of menstrual disorders, such as dysmenorrhea, dysfunctional bleeding and premenstrual tension, and in the treatment of hormon dependent tumours, especially those of the breast or endometrium. At a dose of an acylanilide of the invention which produc s antiprogestational activity in rats no symptoms of toxicity are apparent.

The acylanilid of the invention may be administered to a warm blooded animal in the form of a

pharmaceutical or veterinary composition which comprises the acylanilide in association with a pharmaceutically acceptable dilu nt or carrier.

The composition may be in a form suitable for oral dosage, as a tablet, capsule, aqueous or oily solution or suspension or emulsion. It may alternatively be in the form of a sterile solution or suspension suitable for parenteral administration, or be in the form of an ointment or lotion for topical administration or be in the form of a suppository for anal or vaginal administration.

The composition may additionally contain one or more drugs selected from anti-oestrogens, for example tamoxifen; progestins, for example medroxyprogesterone acetate; inhibitors of gonadotrophin secretion, for example danazol; cytotoxic agents, for example cyclophosphamide; antibiotics, for example penicillin or oxytetracyclin; and anti-inflammatory agents, for example, especially for topical use, fluocinolone acetonide.

The acylanilide of the invention will normally be administered to a warm-blooded animal at a dose of between 0.1 mg. And 125 mg. Per kg. bodyweight.

The invention is illustrated but not limited by the following Examples:-

Example 1

Thionyl chloride (0.73 ml.) Was added to a stirred solution of 2-hydroxy-3-phenyl-2-trifluoromelthyl-propionic acid (2.34 g.) In N,N-dimethylacetamide (40 ml.) which was cooled to -15° C., at such a rate that that temperature was maintained, and the mixture was stirred at that temperature for 15 minutes. 3-Chloro-4-cyanoaniline (1.5 g.) Was added, the mixture was stirred at -15° C. for 15 minutes and then at laboratory temperature for 15 hours, and was then poured into water (800 ml.). The mixture was extracted six times with diethyl ether (80 ml. each time) and the combined extracts were washed successively (50 ml. portions each time) twice with aqueous 2N-hydrochloric acid, once with saturated aqueous sodium chloride solution, twice with saturated aqueous sodium bicarbonate solution, and again once with saturated aqueous sodium chloride solution, dried over magnesium sulphate and evaporated to dryness under reduced pressure. The residue was purified by chromatography on a silica gel column (Merck 7734) using a 1:1 v/v mixture of ethyl acetate and petroleum ether (b.p. 60-80° C.) as eluant. The product was crystallised from toluene and there was thus obtained 3-chloro-4-cyano-N-(2-hydroxy-3-phenyl-2-trifluoromethylpropionyl)aniline,m.p. 153-154° C.

The 2-hydroxy-3-phenyl-2-trifluoromethylpropionic acid used as starting material was prepared as follows:-

1,1,1-Trifluoro-3-phenylpropan-2-one (8.2 g, obtained by the process described in the Journal of Organic Chemistry, 1967, 32, 1316) was added dropwise to a cooled stirred solution of potassium cyanide (3.2 g.) In water (12 ml.) at such a rate that the temperature of the mixture was maintained at between 0° and 5° C. A 4:1 v/v mixture of water and concentrated sulphuric acid (60 ml.) was added at such a rate to maintain the above temperature, and the mixture was then stirred at laboratory temperature for 15 hours and then extracted three times with diethyl ether (20 ml. each time). The combined extracts were washed three times with water (25 ml. each time), dried overmagnesium sulphate and evaporated to dryness under reduced pressure.

A mixture of the cyanhydrin thus obtained (3.0 g.), concentrated aqueous hydrochloric acid (24 ml.) and acetic acid (6 ml.) was heated in a sealed tube at 110° C. for 6 hours, cooled and poured onto ice. The aqueous mixture was extracted four times with diethyl ether (25 ml. each time) and the combined ethereal solutions were extracted twice with saturated aqueous sodium bicarbonate solution (40 ml. each time). The combined extracts were acidified with aqueous hydrochloric acid and then extracted twice with diethyl ether (40 ml. each time). The combined extracts were dried over magnesium sulphate and evaporated to dryness and the residue was crystallised from cyclohexane. There was thus obtained 2-hydroxy-3-phenyl-2-trifluoromethylpropionic acid, m.p. 123-124° C.
